

IN THE SPECIFICATION

Please amend the paragraph within the specification beginning on page 13, line 1 with the following:

ABSTRACT

An arrangement is disclosed for receiving a digital signal from a transmission medium. The arrangement comprises a variable equalizer (6) for equalizing a received signal so as to obtain an equalized signal, and bit-detector (12) for detecting a sequence of bits from the equalized signal. The arrangement further comprises an asynchronous sampling unit (4) for sampling a received analog signal so as to obtain a first signal having asynchronous samples.——To control the variable equalizer (16, 18, 20) a control signal is generated from the values of at least one sample of a signal having asynchronous samples, at either side of a zero crossing in said signal.
